-i- FUNCTION: PLATELET-DERIVED GROWTH FACTOR IS A POTENT MITOGEN FOR CELLS OF MESENCHYMAL ORIGIN. BINDING OF THIS GROWTH FACTOR TO ITS AFFINITY RECEPTOR ELICITS A VARIETY OF CELLULAR RESPONSES. IT IS RELEASED BY PLATELETS UPON WOUNDING AND PLAYS AN IMPORTANT ROLE IN STIMULATING ADJACENT CELLS TO GROW AND THEREBY HEAL THE WOUND.

-i- SUBUNT: ANTIPARALLEL DISULFIDE-LINKED DIMER OF NONLOENTICAL (A AND B) CHAINS. HOMODIMERS OF A AND B CHAINS ARE IMPLICATED IN

THE LONGER FORM (PLGF-2) CAN ALSO BIND HEPARIN. IT IS ABLE TO POTENTIATE THE ACTION OF LOW LEVELS OF VEGF.
SUBUNIT: HOMODIMER, DISULFIDE-LINKED.
SUBCELLULAR LOCATION: BOTH FORMS ARE SECRETED BUT THE LONGER FORM APPEARS TO REMAIN CELL ATTACHED UNLESS RELEASED BY HEPARIN.
ALTERNATIVE PRODUCTS: 2 ISOFORMS; PLGF-1 AND PLGF-2 (SHOWN HERE); ARE PRODUCED BY ALTERNATIVE SPLICING. PLGF-1 DIFFERS FROM PLGF-2 IN LACKING A 21 RESIDUES SEGMENT IN THE C-TERMINAL SECTION WHICH ACTS AS A CELL RETENTION SIGNAL.
TISSUE SPECIFICITY: WHILE BOTH FORMS ARE PRESENT IN MOST PLACENTAL AND ONLY THE SHORTER FORM IS SPECIFIC TO EARLY (8 WEEK) PLACENTA AND ONLY THE SHORTER FORM IS FOUND IN THE COLON AND MAMMARY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PTM: N-CLYCOSYLATED.
SIMILARITY: BELONGS TO THE PDGF/VEGF FAMILY OF GROWTH FACTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CARCINOMAS
